Abstracts

Crystalline Trehalose occurs as a nonhygroscopic, white, crystalline powder. It is obtained through enzymatic conversion of food grade starch into a stable, nonreducing disaccharide with two glucose molecules linked in a α , β -1, 1 configuration. The powder is freely soluble or readily dispersible in water. Trehalose is typically used in its dehydrate form. Trehalose has about 45% the sweetness of sucrose at concentrations above 22%, but when the concentration is reduced, its sweetness decreases more quickly than that of sucrose.

This report studies the global Crystalline Trehalose production, demand, key manufacturers, and key regions.
