According to our (Global Info Research) latest study, the global CTP Battery Structural Adhesive market size was valued at US\$ 1040 million in 2025 and is forecast to a readjusted size of US\$ 2407 million by 2032 with a CAGR of 12.6% during review period.

CTP battery structural adhesive is a high-performance functional bonding material used in Cell-to-Pack (CTP) battery systems for electric vehicles. It provides structural fixation, vibration damping, sealing, and thermal-assisted management between battery cells, pack housing, and cooling structures. In CTP architectures, module structures are eliminated, so structural adhesives become a critical load-bearing and safety-enabling material ensuring mechanical integrity, durability, and thermal reliability of the battery pack. In 2025, global CTP battery structural adhesive production reached approximately 55.07 Kilotons. The CTP battery structural adhesive industry chain consists of upstream raw materials including epoxy resins, polyurethane resins, silicone materials, thermally conductive fillers (alumina, boron nitride, graphite), and curing agents.

Battery Cell-to-Pack (CTP) structural adhesives are critical functional materials in the evolution of electric vehicle (EV) battery architectures from traditional module-based designs (CTM) toward module-less integration systems (CTP/CTC). These adhesives are primarily used for high-strength bonding between battery cells, pack housings, cooling systems, and structural components, while also providing vibration damping, sealing protection, and partial thermal management functions. With the rapid adoption of CTP technology, the internal architecture of battery packs has been simplified from a three-layer structure (cell?module?pack) to a two-layer structure (cell?pack). As a result, structural adhesives have evolved from auxiliary materials into key load-bearing

and safety-critical components within the battery system. This transition significantly raises performance requirements, including high mechanical strength, thermal cycling resistance, flame retardancy, and thermal conductivity compatibility.
