Abstracts

The global Cumene Hydroperoxide market size is expected to reach \$ 359 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Cumene peroxide (CPH) is an important organic peroxide, appearing as a colorless to pale yellow oily liquid with a characteristic aromatic odor. It is a strong oxidizing agent and free radical initiator in organic synthesis, primarily used in the production of phenol and acetone, as well as in the graft polymerization of ABS resin.

The upstream core raw material is cumene, typically produced by the alkylation reaction of benzene and propylene under an acidic catalyst. Therefore, it is significantly affected by fluctuations in crude oil and basic petrochemical product prices. Furthermore, high-purity oxygen or air is an essential input for production. The midstream stage involves the production and enrichment of CPH, with technological barriers concentrated in the control of catalytic-free liquid-phase oxidation processes for hydrocarbons.

Global sales in 2025 are estimated at around 130,000 tons, with an average market price of approximately \$2,010 per ton. The industry's gross profit margin is expected to range from 15% to 30%.

The industry's driving factors primarily stem from the rigid growth in demand for high-performance materials in the end-consumer market and the green iteration of process routes. In unsaturated polyester and vinyl ester systems, CHP is often used as one of the organic peroxides that initiate curing. Industrial-grade TDS also positions it as an 'economical initiator' suitable for environmental and temperature-curing scenarios, emphasizing its ability to be used alone or in combination with other peroxides to match different thicknesses and curing temperature windows. Meanwhile, the evolution of process routes in the propylene oxide (PO) field may also periodically alter the market

outlook for CHP.
