Abstracts

The global Cured-In-Place Pipe (CIPP) Liner market size is expected to reach \$ 3073 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Cured-In-Place Pipe (CIPP) liner is a flexible tubular renovation material designed exclusively for trenchless pipeline renewal projects. It is manufactured with high-strength fiber base materials and saturated with special thermosetting resin mixtures in advance. This soft liner can be smoothly dragged or inverted into aging, cracked or leaking underground pipelines, closely fitting the inner wall of original pipes. After adopting ultraviolet light, hot water or steam curing treatment, the liner will undergo stable chemical crosslinking reaction and harden into a rigid integrated new pipe body, which effectively restores structural bearing capacity, anti-leakage performance and smooth conveying function of damaged pipelines without destructive ground excavation.

In 2025, global Cured-In-Place Pipe (CIPP) Liner production reached approximately 16,215 kilometers, with an average global market price of around US\$ 130 per meter. The production capacity of Cured-In-Place Pipe (CIPP) Liner is approximately 20,525 kilometers per year, the average gross profit margin was 28-31%.

The upstream supply chain of Cured-In-Place Pipe (CIPP) Liner mainly includes base textile materials, resin systems, reinforcement materials, coating films, curing initiators, additives, packaging materials, and liner impregnation equipment. Common upstream materials include polyester felt, glass fiber, nonwoven fabric, PE/PP/PU coating films, unsaturated polyester resin, vinyl ester resin, epoxy resin, photoinitiators, catalysts, fillers, and stabilizers. These materials are processed into flexible tubular liners, which may be supplied as dry liners or pre-impregnated liners depending on the curing

technology and project requirements. The midstream mainly includes liner design, cutting, sewing, coating, resin impregnation, quality testing, storage, transportation, and technical support. The downstream side includes municipal sewer operators, water utilities, drainage network owners, industrial pipeline operators, trenchless rehabilitation contractors, road and infrastructure maintenance departments, and building pipeline repair service providers.

The cost structure of Cured-In-Place Pipe (CIPP) Liner is mainly composed of raw material cost, resin or impregnation cost, liner manufacturing cost, quality control cost, packaging and cold-chain or storage cost, transportation cost, technical service cost, and project-support cost. Raw materials usually account for the largest share, especially felt or glass-fiber reinforcement, resin systems, coating films, catalysts, photoinitiators, and additives. For UV-CIPP liners, glass fiber, UV-curable resin, coating film, and light-curing compatibility requirements increase the material and quality-control cost. For felt CIPP liners, polyester felt, resin absorption performance, liner thickness, diameter, and wall strength are the key cost drivers. Manufacturing costs include cutting, stitching, coating, calibration, resin impregnation, vacuum processing, curing-performance testing, dimensional inspection, and labor. Additional costs come from refrigerated storage for certain pre-impregnated liners, customized diameter or thickness requirements, certification, waste control, technical documentation, and on-site installation support.
