According to our (Global Info Research) latest study, the global Curing Bladder market size was valued at USD 504.5 million in 2023 and is forecast to a readjusted size of USD 619.1 million by 2030 with a CAGR of 3.0% during review period.

Curing is the process of applying pressure to the green tire in a mold in order to give it its final shape, and applying heat energy to stimulate the chemical reaction between the rubber compounds and other materials. In this process the green tire is automatically transferred onto the lower mold bead seat, a rubber bladder is inserted into the green tire, and the mold closes while the bladder inflates. As the mold closes and is locked the bladder pressure increases so as to make the green tire flow into the mold, taking on the tread pattern and sidewall lettering engraved into the mold. The bladder is filled with a recirculating heat transfer medium, such as steam, hot water, or inert gas. At the end of cure, the pressure is bled down, the mold opened, and the tire stripped out of the mold.
