According to our (Global Info Research) latest study, the global Curing Polymer Microfluidic Chip market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Curable polymer microfluidic chips are microfluidic chips made of curable polymer materials (such as polydimethylsiloxane (PDMS), epoxy resin, polyurethane, etc.). This chip allows precise manipulation of microfluidics in micron-sized microtubes to perform various functions of traditional physical, chemical or biological experiments on micron-sized chips. Curable polymer materials have good processability and plasticity, and complex microchannel structures can be prepared through microfabrication techniques such as mold forming and photolithography. These materials can maintain stable shape and performance after curing, meeting the requirements of microfluidic chips for material stability and durability. Curable polymer microfluidic chips are widely used in many fields such as biology, medicine, chemistry, physics, etc. For example, in the field of biology, it can be used for cell culture, protein analysis, gene sequencing, etc.; in the field of medicine, it can be used for disease diagnosis, drug screening, etc.

As an important branch of microfluidic chips, the market size of cured polymer microfluidic chips has shown a steady expansion trend in recent years with the continuous progress of micro-nano processing technology and biotechnology. Especially in the fields of biological analysis, drug screening, disease diagnosis, etc., the application of cured polymer microfluidic chips is becoming more and more extensive. As people pay more attention to health, environmental protection and other issues, the demand for cured polymer microfluidic chips in disease diagnosis, environmental monitoring and other fields is also increasing. At the same time, the rise
