Abstracts

According to our (Global Info Research) latest study, the global Current Collector Coating Material market size was valued at US\$ 2301 million in 2025 and is forecast to a readjusted size of US\$ 7172 million by 2032 with a CAGR of 17.6% during review period.

In 2025, the global production of current collector coating material reached approximately 27,900 tons, with an average global market price of around US\$80/kg. In the same year, the global total production capacity of current collector coating material reached 34,800 tons. The industry average gross profit margin of this product reached 37%. Current collector coating materials are functional materials applied to the surface of metal current collectors in electrochemical energy storage devices such as lithium-ion batteries, sodium-ion batteries, and supercapacitors. They are primarily used to improve the interfacial bonding performance, conductivity, corrosion resistance, and cycle stability between current collectors (such as aluminum foil, copper foil, and stainless steel foil) and active materials. Their core functions include reducing interfacial contact resistance, improving electrode adhesion, inhibiting electrolyte corrosion, reducing metal oxidation and shedding during cycling, and further enhancing fast-charging capability, high-rate performance, and battery life. Common products include conductive carbon coatings, graphene coatings, CNT coatings, conductive polymer coatings, ceramic composite coatings, and corrosion-resistant functional coatings, widely used in power batteries, energy storage batteries, consumer electronics batteries, and solid-state battery systems.

The upstream of the current collector coating material industry chain mainly includes suppliers of copper foil, aluminum foil, nano-conductive agents, PVDF/SBR binders,

solvents, functional additives, and coating equipment. The midstream consists of current collector coating material R&D and manufacturing companies and coating processing companies, responsible for formula design, slurry preparation, precision coating, drying, and surface treatment. The downstream comprises lithium battery manufacturers, supercapacitor companies, and energy storage system integrators, ultimately applying the material to new energy vehicles, energy storage power stations, consumer electronics, power tools, eVTOL, robotics, and the low-altitude economy. With the increasing demand for high energy density and fast charging, the industry chain is evolving towards 'high conductivity + high adhesion + high voltage resistance + ultra-thinness,' while simultaneously driving the upgrading of water-based, low-cost, and large-scale roll-to-roll coating processes.

Current collector coating materials are becoming an important incremental link in high-performance batteries. As new energy vehicles develop towards 800V high-voltage platforms, 4C-6C fast charging, long battery life, and high safety, traditional bare copper foil and bare aluminum foil can no longer meet the requirements for interface stability, and functional coatings will gradually become the mainstream configuration. Especially in silicon-carbon anode, high-nickel cathode, sodium-ion battery, and solid-state battery systems, the current collector interface problem is more prominent, leading to a rapid increase in demand for coatings with high adhesion, high corrosion resistance, and low impedance. On the other hand, the energy storage market's requirements for long cycle life and low cost of electricity are also driving up the penetration rate of coating materials. In the future, the industry will benefit from the expanding electricity demand of global new energy vehicles, energy storage, and AI computing infrastructure. It is expected that high-end functional current collector coatings will gradually evolve from 'optional materials' to 'standard configuration,' and industry concentration and technological barriers will continue to increase.
