A curved linear guide, also known as a curved linear motion system or a curved rail, is a mechanical component used to guide and support the movement of objects along a curved path. It provides a smooth and controlled motion in applications where straight linear guides cannot be used due to the required curved trajectory. A curved linear guide typically consists of a track or rail that is designed in a curved shape. The track is often made of a hardened material, such as steel or aluminum, to provide strength and durability. It may have a profile that matches the curvature of the desired path or have multiple segments joined together to create the desired curve.
