## Abstracts

The global Custom Recombinant Protein Production Service market size is expected to reach \$ 2181 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Custom recombinant protein production service is a personalized biotechnology outsourcing service that provides tailored protein development and manufacturing according to client requirements; relying on genetic engineering, microbial fermentation, mammalian cell culture, protein purification and quality control technologies, it covers the whole process from gene synthesis, vector construction, host cell expression system screening, large-scale culture, protein purification to endotoxin removal and lyophilization preparation, supplying high-purity, customized recombinant proteins for scientific research, drug development, in vitro diagnosis and biological product development, and meeting non-standard, targeted protein preparation demands that cannot be satisfied by commercial off-the-shelf products.

The industry is trending toward GMP-compliant clinical-grade production, AI-assisted gene sequence optimization, high-density cell culture and integrated one-stop CRO/CDMO services, gradually shifting from laboratory-scale research services to commercial-scale manufacturing; opportunities are driven by the rapid development of antibody drugs, therapeutic proteins, mRNA vaccines, cell therapy and in vitro diagnostic reagents, continuous growth in global biomedical R&D investment, and the rising outsourcing rate of protein production among pharmaceutical enterprises and research institutions; meanwhile, the sector faces challenges including high technical barriers for difficult-to-express proteins, strict requirements for product stability and batch consistency, high costs of GMP production line construction and quality control,

risks of gene sequence confidentiality and intellectual property disputes, and pressure to shorten delivery cycles while controlling production costs.
