Abstracts

According to our (Global Info Research) latest study, the global CVT Automatic Motorcycle market size was valued at US\$ 6956 million in 2025 and is forecast to a readjusted size of US\$ 11924 million by 2032 with a CAGR of 8.0% during review period.

In 2025, the global production of CVT automatic motorcycle reached approximately 2.25 million units, with an average global market price of around US\$3,000 per unit. In the same year, the global total production capacity of CVT automatic motorcycle reached 2.81 million units. The industry average gross profit margin of this product reached 33%. CVT automatic transmission motorcycles refer to two-wheeled motor vehicles that use a continuously variable transmission (CVT). Their core feature is the continuous change of the transmission ratio through a belt and variable-diameter pulley system, replacing the gear-shifting structure of traditional manual transmissions. This allows for continuous power output during starting, acceleration, and cruising without manual shifting. These models are typically scooters, but have gradually expanded to include some motorcycles and light recreational vehicles. Their core advantages lie in simplified operation, smooth driving, high efficiency for urban commuting, and relatively low maintenance costs, thus holding a significant share of the urban commuting market in Asia and Europe.

The upstream of the CVT automatic motorcycle industry chain mainly includes suppliers of engine systems, CVT core components, aluminum alloy die-casting parts, steel and rubber materials, and electronic control systems. The midstream consists of vehicle manufacturers responsible for vehicle design, powertrain integration, assembly, and testing. The downstream includes dealer networks, cross-border export channels, e-

commerce platforms, and after-sales service systems. Furthermore, with the development of electrification, some companies have incorporated "electric drive + CVT-like structure" into their next-generation powertrains, further extending the industry chain to electronic control systems, battery management systems, and software control algorithms.

CVT automatic transmission motorcycles still have stable growth potential globally, driven primarily by accelerated urbanization, rising demand for low-cost commuter vehicles in emerging Asian and South American markets, and the continued expansion of micromobility in European and American markets. Future growth will also be influenced by the substitution effect of electric scooters, but CVTs still have a long lifecycle in the existing gasoline motorcycle market and the low-to-mid-range commuter market. In terms of technological evolution, future products will develop towards lightweight CVT structures, high-durability belt materials, low-loss transmission efficiency, and hybrid/electric drive integration. Overall, this market segment will gradually shift from "incremental expansion" to a development stage of "structural upgrading + regional substitution."
