Abstracts

According to our (Global Info Research) latest study, the global CW Deep UV Lasers market size was valued at US\$ 63.6 million in 2024 and is forecast to a readjusted size of USD 129 million by 2031 with a CAGR of 10.8% during review period.

Due to its small size, narrow linewidth, and high reliability, deep ultraviolet lasers are used in optical emission spectroscopy, Raman spectroscopy, and precision micromachining. There are two ways to achieve deep ultraviolet laser output: sum frequency and frequency multiplication. Compared with the frequency doubling technology, the sum frequency is more complex, the stability is poor, and its application conditions are relatively harsh, but it can achieve shorter wavelengths; the realization of all-solid-state deep-ultraviolet laser output through the multi-harmonic conversion of nonlinear crystals is the development of the whole It is an effective way for solid-state deep ultraviolet laser sources, but it will be limited by the transmittance and phase matching conditions of nonlinear crystals in the deep ultraviolet region.

Deep ultraviolet lasers can be divided into two categories: pulsed and continuous. At present, domestic enterprises mainly produce pulsed deep ultraviolet lasers, while high-power continuous wave lasers are monopolized by foreign countries.

Due to the complexity of sum-frequency technology, poor stability and practical difficulties, although sum-frequency technology has harsh application conditions, it is easier to realize short-wave DUV than frequency doubling technology; nonlinear frequency conversion technology, new and efficient nonlinear frequency conversion crystal Issues such as frequency conversion and frequency technology are the focus of ultraviolet laser research; realizing all-solid-state deep-ultraviolet laser output through

nonlinear crystal multi-harmonic conversion is an effective way to develop all-solid-state deep-ultraviolet laser sources. This technology is limited by nonlinear Transmittance and phase matching conditions of crystals in the deep ultraviolet band. At present, the method to achieve deep ultraviolet output is mainly frequency doubling technology, and this technology is realized through nonlinear crystals. The output power of all solid-state deep ultraviolet lasers at home and abroad is relatively low, so the development direction of all solid-state deep ultraviolet lasers in the future is mainly Discovering new nonlinear crystals and improving output power, high beam quality, and narrow linewidth deep ultraviolet laser sources are important tasks for deep ultraviolet lasers.
