Abstracts

The global Cyber Deception Technology market size is expected to reach \$ 6121 million by 2032, rising at a market growth of 9.2% CAGR during the forecast period (2026-2032).

Cyber Deception Technology is a proactive cybersecurity approach that places believable decoys, lures, and honeypots (for example, fake hosts, services, credentials, files, or "breadcrumbs") inside real environments so that when an intruder interacts with something that should never be touched, defenders get an immediate, high-confidence signal and useful context about what the attacker is doing. In modern framing, it's increasingly treated as part of "adversary engagement," where defenders intentionally shape an attacker's path to expose and better understand malicious activity rather than relying only on perimeter prevention.

What makes deception uniquely valuable today is how directly it tackles operational pain points in security operations: too many noisy detections, too little clarity during lateral movement, and the challenge of distinguishing stealthy hands-on-keyboard activity from normal admin behavior. Deception shifts the burden of proof—interactions with planted decoys are inherently suspicious—so alerts often arrive with higher fidelity and stronger investigative starting points, while also disrupting attacker automation and decision-making by feeding them believable but false targets. This "create signals that shouldn't exist" model complements existing EDR/XDR and SIEM pipelines by adding a low-noise layer that can validate compromise earlier and accelerate triage with richer attacker telemetry.

Industry momentum is being driven by practical realities: enterprises are more distributed across cloud and hybrid infrastructure, identity and credential abuse is

central to many intrusions, and AI-assisted automation is accelerating the speed and scale of attacks—raising the premium on controls that generate clear signals when attackers are already inside. At the same time, deception is becoming less of a niche "honeypot project" and more of an operational product category, reflected in national-level efforts to build evidence on real-world use cases and in the way larger security vendors have acquired and integrated deception capabilities into broader platforms. Looking forward, the strongest market potential sits in deception becoming an embedded, widely adopted detection layer—especially around identity, cloud workloads, and incident response workflows—because it offers a rare combination of high-confidence detection and actionable context without requiring perfect prediction of every new tactic.
