Abstracts

According to our (Global Info Research) latest study, the global Cyclohexyl Hydroperoxide market size was valued at US\$ 686 million in 2025 and is forecast to a readjusted size of US\$ 966 million by 2032 with a CAGR of 5.0% during review period.

Cyclohexyl Hydroperoxide (CHHP) is an organic hydroperoxide (ROOH) intermediate primarily produced via the controlled liquid-phase oxidation of cyclohexane using air or oxygen, typically in the presence of metal catalysts such as cobalt or manganese salts; it is a key intermediate in oxidation chemistry and is most notably used in the industrial synthesis of cyclohexanone and cyclohexanol (KA oil), which are further converted into adipic acid and caprolactam for nylon production. In the supply chain, upstream inputs include petrochemical feedstocks (cyclohexane derived from benzene hydrogenation), oxygen/air, and oxidation catalysts; midstream processing involves oxidation reactors, separation, and stabilization systems due to the compound's thermal instability and sensitivity to decomposition; downstream, CHHP is either directly decomposed into ketone/alcohol mixtures or used as an initiator or oxidizing agent in specialty chemical synthesis, polymer processing, and fine chemicals. The value chain is closely integrated with large petrochemical and nylon intermediates producers (e.g., integrated benzene?cyclohexane?KA oil chains), with production typically captive rather than merchant due to safety, handling, and process integration considerations. In 2025, global Cyclohexyl Hydroperoxide output was about 500,000 tons with 700,000 tons of capacity, average prices of USD 1,200?1,900 per ton, and gross margins around 25%.
