## Abstracts

According to our (Global Info Research) latest study, the global Cyclone Separation market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A cyclonic separation is a method of removing particulates from an air, gas or liquid stream, without the use of filters, through vortex separation. When removing particulate matter from liquid, a hydrocyclone is used; while from gas, a gas cyclone is used. Rotational effects and gravity are used to separate mixtures of solids and fluids. The method can also be used to separate fine droplets of liquid from a gaseous stream.

Similar separators are used in the oil refining industry (e.g. for Fluid catalytic cracking) to achieve fast separation of the catalyst particles from the reacting gases and vapors.[3]

The Global Info Research report includes an overview of the development of the Cyclone Separation industry chain, the market status of Oil Refining Industry (Hydrocyclone, Gas Cyclone), Sawmills (Hydrocyclone, Gas Cyclone), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Cyclone Separation.
