Abstracts

The global Cyclopropane market size is expected to reach \$ 326 million by 2032, rising at a market growth of 4.1% CAGR during the forecast period (2026-2032).

Cyclopropane is a highly strained three-membered cyclic hydrocarbon (C₃H₆) characterized by significant ring strain due to its 60° bond angles, which makes it far more reactive than typical alkanes; historically it was used as an anesthetic, but today it is mainly an intermediate in organic synthesis, pharmaceuticals, and specialty chemicals. Industrially, cyclopropane is not produced in large commodity volumes but is generated via specialized synthetic routes, most commonly through intramolecular cyclization of 1,3-dihalopropanes (e.g., 1,3-dichloropropane) using metals such as zinc or sodium, or via carbene addition (Simmons-Smith reaction) to alkenes in fine chemical manufacturing. The supply chain begins with upstream petrochemical feedstocks such as propylene (derived from steam cracking or refinery processes) and chlorinated intermediates, followed by midstream synthesis in controlled batch or continuous reactors by specialty chemical manufacturers, and downstream purification, compression, and handling due to its gaseous and highly flammable nature. End distribution is typically limited to industrial gas suppliers and fine chemical distributors serving pharmaceuticals, agrochemicals, and research sectors, rather than broad bulk chemical markets, reflecting its niche, high-value positioning. In 2025, global Cyclopropane output was about 18,000 tons with 30,000 tons of capacity, average prices of USD 12,000-18,000 per ton, and gross margins around 29%.

This report studies the global Cyclopropane production, demand, key manufacturers, and key regions.
