Abstracts

According to our (Global Info Research) latest study, the global Cyclopropane market size was valued at US\$ 246 million in 2025 and is forecast to a readjusted size of US\$ 326 million by 2032 with a CAGR of 4.1% during review period.

Cyclopropane is a highly strained three-membered cyclic hydrocarbon (C₃H₆) characterized by significant ring strain due to its 60° bond angles, which makes it far more reactive than typical alkanes; historically it was used as an anesthetic, but today it is mainly an intermediate in organic synthesis, pharmaceuticals, and specialty chemicals. Industrially, cyclopropane is not produced in large commodity volumes but is generated via specialized synthetic routes, most commonly through intramolecular cyclization of 1,3-dihalopropanes (e.g., 1,3-dichloropropane) using metals such as zinc or sodium, or via carbene addition (Simmons-Smith reaction) to alkenes in fine chemical manufacturing. The supply chain begins with upstream petrochemical feedstocks such as propylene (derived from steam cracking or refinery processes) and chlorinated intermediates, followed by midstream synthesis in controlled batch or continuous reactors by specialty chemical manufacturers, and downstream purification, compression, and handling due to its gaseous and highly flammable nature. End distribution is typically limited to industrial gas suppliers and fine chemical distributors serving pharmaceuticals, agrochemicals, and research sectors, rather than broad bulk chemical markets, reflecting its niche, high-value positioning. In 2025, global Cyclopropane output was about 18,000 tons with 30,000 tons of capacity, average prices of USD 12,000-18,000 per ton, and gross margins around 29%.
