## Abstracts

The global Cylindrical Clutch market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A cylindrical clutch is a common mechanical transmission device used to transfer or disconnect power between two rotating shafts. It consists of a cylindrical friction plate and a pressure plate. When the pressure plate exerts force to bring the friction plate into contact with the adjacent friction surface, the clutch transmits power; when the pressure plate no longer exerts force, the friction plate separates from the friction surface, interrupting power transmission. Cylindrical clutches are usually used in various mechanical equipment and vehicles, such as automobiles, motorcycles, construction machinery, etc. It has the characteristics of simple structure, high reliability and strong carrying capacity. The working principle of the cylindrical clutch is based on the conversion of friction force. By adjusting the force of the pressure plate or changing the material and surface characteristics of the friction plate, the clutch can be controlled and adjusted to adapt to different working conditions and needs.

This report studies the global Cylindrical Clutch production, demand, key manufacturers, and key regions.
