Abstracts

The global Cylindrical Healing Abutment market size is expected to reach \$ 302 million by 2032, rising at a market growth of 3.3% CAGR during the forecast period (2026-2032).

In 2024, global Cylindrical Healing Abutment production reached approximately 15,000 k units with an average global market price of around US\$ 15 per unit, and a gross profit margin of approximately 10%-30%. A cylindrical healing abutment is a temporary transmucosal component used in dental implant therapy, characterized by a predominantly straight, cylinder-shaped profile from the implant platform through the soft tissue. After an implant fixture is placed and covered or partially exposed, the cylindrical healing abutment is screwed onto the implant either at the time of surgery (one-stage protocol) or at a second-stage uncover. It protrudes through the gingiva to protect the internal connection of the implant, maintain a soft-tissue access channel, and allow the surrounding mucosa to heal and mature in a controlled way before the final prosthetic abutment and crown are placed. Typically manufactured from medical-grade titanium alloys (such as Ti-6Al-4V ELI) for strength, corrosion resistance, and biocompatibility, cylindrical healing abutments are available in a range of diameters that correspond to different implant platform sizes and in multiple collar heights to adapt to soft-tissue thickness in anterior and posterior regions. In the upstream segment, cylindrical healing abutments depend on medical-grade titanium and titanium-alloy bar or rod stock, together with smaller volumes of high-performance polymers such as PEEK for alternative or hybrid designs. Suppliers of precision multi-axis CNC lathes and mills, CAD/CAM software, metrology systems and surface-treatment chemistry (polishing, anodizing, or specialized micro-topographies) provide the manufacturing backbone. In the midstream, dental implant and prosthetic manufacturers engineer and produce the conical healing abutments as part of their system-specific or compatible component lines. Activities include CAD modeling of the transmucosal cone,

programming CNC machining paths, turning/milling of the titanium blank, surface finishing of the collar to reduce plaque retention, and laser-marking of platform, height and diameter codes. In the downstream, cylindrical healing abutments are distributed via implant companies? direct sales forces, national distributors and online stores to private implant practices, group DSOs, hospital oral surgery units and dental laboratories.
