According to our (Global Info Research) latest study, the global Cystoid Macular Edema market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Cystoid macular edema (CME) also known as Irvine Gass Syndrome is a painless disorder affecting the central retina or macula. This condition is characterized by multiple cysts like areas of fluid in the macula causing retinal swelling or edema. CME is the retinal thickening of macula due to disruption of the normal blood-retinal barrier which leads to leakage from the perifoveal retinal capillaries causing accumulation of fluid within the intracellular spaces of the retina, mainly in the outer plexiform layer. CME is of two types: pseudophakic and nonpseudophakic cystoid macular edema. Pseudophakic cystoids macular edema is when the cause of occurrence is known while nonpseudophakic is the condition where no specific clinical findings have been observed. Symptoms of cystoids macular edema are blurred or decreased central vision.

The cause of CME is not completely known though it may be accompanied by various diseases such as uveitis, vein occlusion or diabetes. It is also known to occur commonly after cataract surgery. Various risk factors associated with cystoids macular edema are penetrating keratoplasty (corneal transplant), retinal surgery, chronic renal failure, retinal vein occlusion, retinitis pigmentosa, systemic medication and topical prostaglandin analogs for glaucoma..No significant racial or sex related predilection exists for this condition. However, cystoids macular edema can occur at any age based on the etiology, though advanced age is at higher risk.
