Abstracts

The global Cytogenetic Arrays market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A cytogenetic array, also known as a chromosomal microarray or array-based comparative genomic hybridization (aCGH), is a type of genetic testing technology used to detect and analyze chromosomal abnormalities, such as gains or losses of genetic material.

Cytogenetic chips work by hybridizing small fragments of DNA from a patient's genome onto a glass slide or chip that contains known DNA probes that cover the entire human genome. By measuring the amount of hybridization between the patient's DNA fragments and the probes on the chip, the test can identify and locate chromosomal abnormalities with high resolution. The results of a cytogenetic chip test can be used to diagnose genetic disorders, such as developmental delays, intellectual disabilities, and birth defects, and to inform medical management and genetic counseling.

Cytogenetic chips are commonly used in clinical genetics and prenatal testing, and are often considered a first-line test for detecting chromosomal abnormalities. They have largely replaced traditional karyotyping, a method for visualizing chromosomes under a microscope, due to their higher resolution and ability to detect smaller chromosomal abnormalities.

This report studies the global Cytogenetic Arrays production, demand, key manufacturers, and key regions.
