D-type magnesium anode is a material used for corrosion prevention, which has excellent performance and reliable anti-corrosion effect, playing an important role in extending the service life of equipment and reducing maintenance costs. D-type magnesium anode is achieved by forming an electric couple between the anode and cathode on the metal surface, using current to flow from the anode to the cathode, causing metal dissolution at the anode and thus protecting the metal. Among them, D-type magnesium alloy, as a sacrificial anode material, has a relatively negative potential and strong corrosiveness, and can preferentially undergo corrosion to protect the protected metal.
