Dacromet Coating Service refers to a specialized surface treatment service for metal components, in which a zinc–aluminum flake–based, non-electroplated coating is applied and thermally cured to form a dense protective layer that significantly enhances corrosion resistance under salt spray, humidity, and harsh operating conditions; the service is typically offered as an outsourced coating process for fasteners, springs, structural parts, and automotive or industrial components, providing controlled coating thickness, dimensional stability, and reduced risk of hydrogen embrittlement while complying with environmental requirements. Dacromet Coating Service is typically priced based on component weight, surface area, or throughput, with costs influenced by part size, geometric complexity, coating specifications, and batch volume, generally positioned above standard electroplating but below high-end composite corrosion-protection solutions.
