## Abstracts

The global Dairy Farm Management Software market size is expected to reach \$ 673 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

Dairy Farm Management Software is a digital management system designed for large-scale dairy/goat farming, integrating IoT sensing, data collection and analysis, and standardized process control. Its core functionality lies in real-time monitoring and intelligent analysis of data across all stages of farm operations, including production, breeding, health, feeding, milking, and sales. This enables refined management of the farming process, optimized resource allocation, and improved production efficiency. It features data-driven operations, full-process coverage, intelligent decision-making, and strong scenario adaptability, making it a core technological tool for building modern smart farms.

The integration of artificial intelligence (AI) and the Internet of Things (IoT) technologies has become a core direction for upgrading ranch management software. On one hand, the comprehensive coverage of IoT sensing terminals is driving data collection from 'manual entry' to 'real-time automatic collection.' Software can connect to devices such as smart ear tags, smart milking machines, environmental sensors, and feeding robots to acquire real-time data on cattle physiological indicators (body temperature, rumination frequency, activity level), breeding environment data (temperature, humidity, ammonia concentration), milk production data (milk fat percentage, milk protein percentage), and feeding data, constructing a comprehensive ranch data system. On the other hand, the deep embedding of AI algorithms is upgrading the software from a 'data recording tool' to an 'intelligent decision-making system.' For example, machine learning models can analyze cattle physiological data to accurately predict estrus and disease precursors, enabling early warning and intervention; based on historical milk production data and diet formulation data, feeding programs can be intelligently

optimized to improve feed conversion rate and yield per unit area; and computer vision technology can be used to identify cattle body condition scores to assist in judging growth stage and health status. Furthermore, the gradual implementation of digital twin technology allows for the construction of virtual ranch models, which can simulate the effects of different breeding schemes, providing a scientific basis for ranch expansion and process upgrades.
