A Data Acquisition System (DAS) for analog scanners is an integrated framework designed to convert continuous analog signals captured by scanning probes into a digital format for computational processing. In the context of analog scanning, the system functions by capturing real-time physical variables (such as voltage or frequency) through sensors, followed by signal conditioning (e.g., filtering and amplification). It utilizes high-precision Analog-to-Digital Converters (ADC) and synchronized timing controls to ensure the linearity and spatial accuracy of the resulting scan data.
