According to our (Global Info Research) latest study, the global Data Center CDU Pumps market size was valued at US\$ 288 million in 2025 and is forecast to a readjusted size of US\$ 568 million by 2032 with a CAGR of 10.0% during review period.

A Data Center CDU Pump is the core fluid-moving component installed within a Coolant Distribution Unit (CDU) to circulate coolant through a data center liquid-cooling loop. By generating and maintaining the required flow rate and pressure, the pump delivers coolant to server cold plates, rack manifolds, rear-door heat exchangers, or immersion-cooling equipment and returns the heated coolant to the CDU heat exchanger. This process enables controlled heat transfer between the technology cooling system serving IT equipment and the facility water or heat-rejection system. CDU pumps are generally required to provide high efficiency, low vibration, low leakage, continuous-duty operation, variable-speed control, redundancy, and compatibility with water, glycol-based fluids, or other engineered coolants. In 2025, global Data Center CDU Pumps production reached approximately 117 k Units, with an average global market price of around 2394 USD/Unit. The production capacity for Data Center CDU Pumps in 2025 was approximately 150 k Units. The typical gross profit margin for Data Center CDU Pumps between 20% and 40%.

The global market for data center CDU pumps is being driven by the rapid deployment of artificial intelligence training infrastructure, cloud computing, high-performance computing, and high-power GPU servers. As rack power density continues to increase, conventional air cooling faces thermal-capacity and energy-efficiency limitations in high-heat-flux environments, accelerating the adoption of direct-to-chip cooling, rear-door heat exchangers, and immersion cooling. This transition is increasing demand for

pumps used in rack-level, row-level, and facility-level CDUs. Competitive priorities are shifting from basic flow and head performance toward variable-speed efficiency, N+1 or 2N redundancy, hot-swappable maintenance, leak-resistant construction, real-time flow and pressure monitoring, and integration with data center management systems. As CDU capacities increase and liquid-cooling infrastructure becomes more standardized, pumps offering high reliability, intelligent control, broad operating flexibility, and lower lifecycle energy consumption are expected to gain market share.
