According to our (Global Info Research) latest study, the global Data Center Dry Power Transformer market size was valued at US\$ 349 million in 2025 and is forecast to a readjusted size of US\$ 811 million by 2032 with a CAGR of 11.4% during review period.

A Data Center Dry Power Transformer is a type of electrical transformer used in data center power distribution systems that operates without liquid insulation or cooling media, instead using solid insulation materials such as epoxy resin or cast resin. These transformers convert and regulate voltage levels to ensure stable and reliable power supply for critical IT equipment, servers, and cooling systems. Compared with oil-filled transformers, dry-type transformers offer higher safety, lower fire risk, and reduced maintenance requirements, making them particularly suitable for indoor installation in data centers, server rooms, and mission-critical facilities where reliability and environmental safety are essential. In 2025, global Data Center Dry Power Transformer production reached approximately 21200 units, with an average global market price of around 16000 USD/unit. The production capacity for Data Center Dry Power Transformer in 2025 was approximately 25000 units. The typical gross profit margin for Data Center Dry Power Transformer between 20% and 40%.
