According to our (Global Info Research) latest study, the global Data Center Hyper-Converged Infrastructure (HCI) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The data center hyper-converged infrastructure is a comprehensive solution that integrates computing, storage, and network functions. The traditional data center architecture requires independent servers, storage devices, and network devices to support different functions, while the hyper-converged infrastructure uses software-defined methods to simultaneously run computing, storage, and network functions on a physical server to achieve resource concentration, management and higher resource utilization.

The data center hyper-converged infrastructure has the characteristics of single support, easy deployment, reduced TOC (total cost of ownership), reuse, reduced dependence, simplified management, elastic expansion, and efficient utilization. Data center hyper-converged infrastructure provides higher resource utilization, more flexible resource management, and simpler deployment and maintenance methods, which is of great significance to the construction and operation of modern data centers.
