The global Data Center Indoor Chillers market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Data center indoor chiller is a cooling system used in data centers to regulate the temperature and humidity levels of the facility. It works by removing heat from the air inside the data center and transferring it outside. The indoor chiller unit typically contains a compressor, a heat exchanger, a pump, and a refrigerant, and can be connected to a variety of cooling units, such as air handlers or in-row coolers, to distribute cool air throughout the data center. The use of indoor chillers is a common practice in data center cooling, as it allows for efficient cooling of high-density server environments.
