Abstracts

Data centers are facilities comprising of network computers as well as storage devices, which enterprises utilize for storing, organizing, processing and disseminating huge volumes of data. Data centers host critical systems of a network, which are important for daily operations of enterprise or other organizations. Data centers contain IT equipment such as cables, servers, firewalls, storage sub systems, routers, networking switches and physical racks for organizing as well as interconnecting IT equipment among others. Data centers essentially require infrastructure for power distribution, backup power systems, cooling systems, telecommunication connectivity and ventilation. Businesses host multiple data centers at different locations for handling their data. Internet facing data centers support certain applications for multiple end users. Enterprise data centers cater few end users, but offer more customized applications. Data centers are adopting new technologies such as software defined everything and virtualization for optimal utilization of resources, increasing IT flexibility as well as scalability. Advanced data centers and green data centers have highly efficient power utilization at reduced costs with less usage of air-conditioning and lesser environmental impact. They have power use effectiveness ratio, which measure the power consumed by data center relative to the power consumed for computing, as less than 1.5. Virtual data centers are collection of automated and scalable cloud infrastructure resources, hosted at different locations, for meeting the requirements for computation, networking and storage of business enterprises. Data centers find applications in sectors such as banking, financial institutions, government, healthcare, ITES and retail among others.
