Abstracts

According to our (Global Info Research) latest study, the global DBR and DFB Laser market size was valued at US\$ 307 million in 2024 and is forecast to a readjusted size of USD 488 million by 2031 with a CAGR of 6.9% during review period.

A distributed Bragg reflector laser (DBR) is a type of single frequency laser diode. Other practical types of single frequency laser diodes include DFB lasers and external cavity diode lasers. A distributed-feedback laser (DFB) is a type of laser diode, quantum-cascade laser or optical-fiber laser where the active region of the device contains a periodically structured element or diffraction grating. The structure builds a one-dimensional interference grating (Bragg scattering), and the grating provides optical feedback for the laser. The differences between DBR lasers and DFB lasers. The distinguishing difference between the two architectures is the location of the grating within the epitaxial structure. The DBR uses a high index contrast, high reflectivity surface grating. The DFB uses a low index contrast, low reflectivity buried grating.

Distributed Bragg Reflector lasers (DBR lasers) and Distributed Feedback lasers (DFB lasers) are two significant technologies within the realm of semiconductor lasers. DBR lasers are favored for their broadband tunability and low threshold current, making them suitable for applications in optical communications, sensing, and medical fields. On the other hand, DFB lasers excel in applications such as fiber-optic communications and situations where single longitudinal mode and narrow emission spectra are crucial due to their inherent characteristics. With the ongoing advancement in digital and communication technologies, the demand for higher bandwidth, longer transmission distances, and lower energy consumption continues to rise. Both of these laser technologies, DBR and DFB, are continuously evolving and innovating to meet the ever-

changing demands of the market trends.
