Abstracts

Brushed DC motors are the traditional solution for driving most electrical convenience functions in automotive bodies. Since the brushes provide the commutation function, these motors are simple and relatively inexpensive to drive. At present, the vast majority of automotive micromotors are DC brushed motors. This report mainly studies automotive DC brushed micromotor. Automotive micro motors refer to motors with small volume and capacity, and output power below several hundred watts. Micro motor is one of the key parts of the car. It is mainly distributed in the engine, chassis, body and accessories of the automobile, and gradually becomes an important part of the automobile power system. Among them, micro-motors on engine components are mainly used in automobile starters, electronic injection control systems, water tank radiators and generators. The micro motors on the chassis frame of automobiles are mainly used in automobile electronic suspension control systems, electric power steering devices, automobile stability control systems, automobile cruise control systems, anti-lock brake control systems and drive power control systems. Micro motors on automobile body parts are mainly used in central door lock devices, electric rearview mirrors, automatic lifting antennas, electric sunroofs, automatic headlights, electric car seat adjusters, electric window lifters, electric wipers, air conditioning system, electronic speedometer, etc.
