Abstracts

The global DC Brushless Motor market size is expected to reach \$ 51937 million by 2032, rising at a market growth of 3.8% CAGR during the forecast period (2026-2032).

In 2025, the global production of brushed DC motors reached 2,392 million units, with an average market price of approximately \$14.7 per unit, a production capacity of about 3,500 million units, and an industry average gross margin of 26.18%.

A DC Brushless Motor is a type of motor powered by a direct current (DC) source but without traditional brushes and a mechanical commutator. It uses an electronic controller to switch the current, generating rotational torque. Compared with brushed DC motors, brushless motors have a simpler and more durable structure, lower maintenance costs, higher efficiency, and longer service life. As a result, they are widely used in industrial equipment, automotive applications, new energy systems, and consumer electronics.

The working principle of a brushless DC motor is based on electromagnetic induction. The motor typically consists of a stator winding and a rotor with permanent magnets. Electromagnetic coils are installed on the stator and energized in a specific sequence by the electronic controller to create a rotating magnetic field. The permanent magnets on the rotor interact with this field to produce mechanical torque. The electronic controller switches the current in real time according to rotor position information, enabling continuous rotation. Because there are no brushes or mechanical commutators, the motor runs more smoothly, can achieve high-speed operation, and reduces noise and maintenance issues caused by brush wear.

Structurally, a brushless DC motor mainly consists of the stator, rotor, electronic driver,

bearings, and housing. The stator provides the rotating magnetic field, the rotor produces torque under the magnetic forces, the electronic driver manages commutation and speed control, and the bearings and housing support and protect the internal components. The advantages of brushless DC motors include high efficiency, high power density, long lifespan, low noise, and minimal vibration. They also allow precise speed and position control through the controller. The disadvantages are that they require an electronic driver, which increases cost and control complexity, relies heavily on electronic components, and can make maintenance more difficult.

The main upstream raw materials include the stator, rotor, housing, insulating materials, bearings, and electronic components.

Upstream suppliers include TDK, Ferroxcube, Magnequench, ATL, ArcelorMittal, Nippon Steel, Morgan Advanced Materials, Huntsman, Arkema, among others.

Downstream customers include Delphi, Panasonic, Autoliv, Bosch, BYD, Tesla, ABB, Schneider Electric, and others.
