Abstracts

DC/DC converter is a switching power supply chip, which means that it uses the property of energy storage of capacitors and inductors to perform high-frequency switching action through controllable switches (MOSFETs, etc.) to store the input electrical energy in the capacitor (inductor), and when the switch is disconnected, the electrical energy is then released to the load to provide energy. Its ability to output power or voltage is related to the duty cycle (the ratio of the on-time by the switch to the whole cycle of the switch). Switching power supplies can be used for step-up and step-down.
