According to our (Global Info Research) latest study, the global DCO Coherent Module market size was valued at US\$ 4939 million in 2025 and is forecast to a readjusted size of US\$ 11503 million by 2032 with a CAGR of 12.8% during review period.

A DCO coherent module is a digital coherent optical transceiver module designed for high-speed optical networks. Its core role is to integrate high-speed electrical interface access, coherent modulation, coherent reception, digital signal processing, forward error correction, wavelength tuning, and link monitoring within a pluggable form factor, enabling switches, routers, transport equipment, or open line systems to directly carry high-capacity DWDM wavelengths. Typical form factors include QSFP-DD, OSFP, CFP2-DCO, and QSFP28, while mainstream products cover 100G, 200G, 400G, and 800G rates and are differentiated by transmission reach, power consumption, optical output power, and service adaptation around 400ZR, OpenZR+, OpenROADM, and vendor-enhanced modes. This product mainly addresses the limitations of traditional coherent transmission, including dependence on standalone transponder equipment, low port density, complex deployment, and high cost per bit. Typical customers include cloud data centers, telecom operators, internet backbone networks, metro networks, edge aggregation networks, and large enterprise private-line networks. DCO coherent modules are usually delivered as standardized modules, equipment-vendor-certified modules, compatible modules, or as part of network solutions, with product value concentrated in low-power DSPs, silicon photonics or indium phosphide optical engines, narrow-linewidth tunable lasers, high-sensitivity coherent receivers, CMIS management, and multi-vendor interoperability.

DCO coherent modules are changing the deployment model of high-speed optical

networks. In the past, coherent optical transmission typically relied on dedicated line cards, transponders, or standalone transport equipment, requiring additional devices between the IP layer and the optical layer and increasing space, power, commissioning, and operational complexity. As open standards such as 400ZR, OpenZR+, OpenROADM, and CMIS mature, coherent modulation, coherent reception, DSP processing, forward error correction, and wavelength tuning are being integrated into pluggable form factors such as QSFP-DD, OSFP, and CFP2-DCO, enabling switches and routers to directly originate tunable DWDM wavelengths. This shift makes data center interconnect, metro transport, regional transmission, and edge aggregation networks flatter, reduces intermediate transport layers, improves port density, and lowers cost per bit. As cloud services, cross-campus AI training and inference, video traffic, and enterprise private-line bandwidth continue to grow, DCO coherent modules will expand from high-end carrier deployments into broader cloud-network convergence and open optical networking scenarios.

Industry competition will center on performance, power consumption, manufacturability, and ecosystem compatibility. A DCO coherent module is not a simple optical-electrical converter but a highly integrated system-level device involving low-power coherent DSPs, silicon photonics or indium phosphide optical engines, narrow-linewidth tunable lasers, integrated coherent receivers, thermal management structures, high-speed packaging, and management firmware. In the 400G era, key metrics are concentrated on 120-kilometer-class DCI, metro transmission over hundreds of kilometers, high output power of 0 dBm or above, power consumption within roughly 20 W, and multi-vendor interoperability. In the 800G era, the industry will face higher requirements for advanced DSP process technology, optical engine bandwidth, package thermal design, and host compatibility. Companies with vertically integrated optical component capabilities, coherent algorithm expertise, and scalable manufacturing are more likely to gain cost and delivery advantages, while companies with single-link capabilities will need ecosystem partnerships to enter mainstream supply chains. Over the long term, standardized modules and vendor-enhanced modules will develop in parallel, with the former supporting interoperability and scaled procurement and the latter serving longer reach, higher power, and specific network management needs.

Market demand remains in a positive expansion cycle. 400G DCO coherent modules have already formed relatively clear product patterns in data center interconnect and metro carrier networks, with 400ZR serving short-reach, low-complexity, interoperable deployments, OpenZR+ supporting more flexible multi-rate and longer-reach transmission, and CFP2-DCO as well as high-power QSFP-DD continuing to cover regional and long-reach scenarios. As the industry enters the 800G stage, AI data

centers are no longer driving only intra-rack and intra-campus optical module demand, but also demand for cross-campus, inter-city, and regional data synchronization links, making 800ZR and 800ZR+ likely growth drivers for the next cycle. On the supply side, companies from the United States, Europe, Japan, Korea, mainland China, and Taiwan are participating in modules, DSPs, optical engines, or system ecosystems. Competition will shift from single product introduction to scaled delivery, interoperability certification, customer qualification cycles, and lifecycle quality management. Overall, DCO coherent modules will continue to benefit from cloud computing, AI networking, 5G transport, open optical networks, and IP over DWDM architecture upgrades.
