Abstracts

According to our (Global Info Research) latest study, the global DD Direct Drive Motor market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

DD direct drive motor is a direct drive motor that can be directly connected to the load, eliminating the need for traditional mechanical transmission components such as reducers, gearboxes, pulleys, etc. DD direct drive motors include two types: torque motors and linear motors. Their characteristics are large output torque, low speed, high precision, low noise, energy saving, long life, etc. DD direct drive motors are mainly used in collaborative robots, semiconductor manufacturing equipment, electronic manufacturing equipment, photovoltaic industry and other fields. The working principle of the DD direct drive motor is to generate a traveling magnetic field by controlling the current of the stator winding to drive the movement of the rotor or secondary. The difference between a DD direct drive motor and a cam divider is that the DD direct drive motor can stop at any angle, while the cam divider's station is fixed. The DD direct drive motor has a lighter load and is more expensive, while the cam divider has a heavier load and is less expensive. The control of DD direct drive motors is also relatively complex, requiring high-resolution encoders and dedicated controllers.
