Abstracts

According to our (Global Info Research) latest study, the global DDR6 Chip market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

In 2025, global DDR6 chip production reached 154,000 units, with an estimated average selling price of \$31 per unit. DDR6 chips are next-generation Double Data Rate Synchronous DRAM memory chips, positioned as the mainstream high-speed dynamic random access memory after DDR5. In the future, they will be packaged into DDR6 RDIMM, UDIMM, SODIMM, CAMM2, or server memory modules for use in CPU/SoC main memory systems. The upstream of the industry chain includes high-purity silicon wafers, photoresists, electronic specialty gases, wet electronic chemicals, sputtering targets, CMP materials, EUV/DUV lithography machines, etching, deposition, ion implantation, cleaning, metrology equipment, and advanced packaging materials; the midstream includes DRAM wafer manufacturing, testing, dicing, packaging, and module integration; and the downstream consists of memory module manufacturers, server OEMs, cloud service providers, PC manufacturers, motherboard/CPU platform manufacturers, AI data centers, industrial control, and automotive electronics customers. Gross profit margin is approximately 35%~55%.

In the future, the development of DDR6 chips will focus on higher speeds and bandwidth, lower power consumption, more complex signal integrity requirements, new module form factors (such as CAMM2), initial adoption in servers, main memory upgrades for AI data centers, and the creation of tiered memory architectures alongside CXL, MRDIMM, and HBM technologies. Key drivers include rising memory capacity and bandwidth demands in AI servers, CPU platform upgrades, high DDR5 pricing, and data center infrastructure refreshes.
