Abstracts

According to our (Global Info Research) latest study, the global De-icing Robot market size was valued at US\$ 371 million in 2025 and is forecast to a readjusted size of US\$ 571 million by 2032 with a CAGR of 6.3% during review period.

In 2025, global De-icing Robot production reached approximately 4.5k units, with an average global market price of around US\$80k per unit.

De-icing robots are intelligent maintenance systems specifically designed to address ice accretion on power transmission lines and electrical equipment. Typically configured as suspended or crawling platforms, they can travel along high-voltage conductors, ground wires, or insulator strings, and remove ice through mechanical breaking, thermal melting, vibration/impact, or hybrid methods. Operating with minimal human intervention and often without power outages, these robots help restore mechanical balance and electrical safety of iced lines. By integrating electrical insulation, precise drive systems, environmental sensing, and remote control, power-line de-icing robots can work reliably in low temperatures, strong winds, and complex terrains, significantly reducing the risks of manual high-altitude operations and enhancing grid resilience and emergency response capability during icing events.

Upstream for de-icing robots is largely an electromechanical and materials supply chain: structural and insulation materials (aluminum alloys/high-strength steels, engineering plastics and insulating parts such as epoxy and silicone rubber, seals, cable jackets); core mechatronics (motors and gearboxes, bearings, conductive/insulating connectors, brakes and clamping modules, heating elements or cutting blades, plus lithium batteries and BMS); and electronics/communications (MCU/SoC, CAN/Ethernet/wireless modules, GNSS/IMU, industrial cameras, thermal/ice sensors). Midstream OEMs

integrate mechanical design, energized-line safety insulation, control algorithms, remote communication platforms, validation for harsh environments, and field deployment services. Downstream demand mainly comes from transmission O&M teams and grid operators (e.g., State Grid and other transmission operators), along with their maintenance service ecosystems, where icing resilience has become an important capability.

The annual production capacity of a single-line De-icing Robot is approximately 200 unit, with a gross profit margin of approximately 25%-45%.
