The decanter sedimentation centrifuge is a common centrifugal separation equipment, mainly used for solid-liquid separation and suspension separation. It adopts a horizontal drum structure with a spiral slag scraping device inside, which separates the solid particles in the suspension from the liquid through the centrifugal force generated by high-speed rotation.

The working process of the decanter sedimentation centrifuge includes: feeding, separation, spiral scraping, and slag discharge. It has the characteristics of efficient separation, stable operation, and strong adaptability. Through the application of this equipment, solid and liquid phases can be effectively separated to improve production efficiency and product quality.
