A Deck Decompression Chamber (DDC) is a pressurized chamber used in diving operations to help divers safely return to normal atmospheric pressure after being exposed to high-pressure underwater environments. It is typically located on a ship or platform and is essential for preventing decompression sickness (commonly known as 'the bends'), which occurs when divers ascend too quickly and nitrogen bubbles form in their bloodstream. The DDC allows divers to undergo controlled decompression in a pressurized environment, simulating a gradual ascent. It is commonly used in commercial diving, military diving, and offshore industries where deep or prolonged underwater activities are conducted. Additionally, DDCs can be used in medical hyperbaric treatments for divers and patients with conditions requiring high-pressure oxygen therapy.
