The decolorizing tower is a closed vacuum container, a tower-type equipment used for continuous decolorization of oils and fats. Its working principle is that the oils and adsorbents enter the decolorizing tower from the upper part or upper side, and the adsorbents and oils are fully and evenly mixed with the help of steam stirring or mechanical stirring. Under the action of the adsorbent, the pigment in the oils and fats is adsorbed and removed, and the decolorized oils and adsorbents adsorbed with pigments are mixed from the bottom of the tower and enter the filtering equipment for subsequent treatment.
