Abstracts

According to our (Global Info Research) latest study, the global Deep Packet Inspection (DPI) market size was valued at USD 5600.1 million in 2023 and is forecast to a readjusted size of USD 25140 million by 2030 with a CAGR of 23.9% during review period.

Deep packet inspection (DPI) is a form of filtering used to inspect data packets sent from one computer to another over a network. DPI is a sophisticated method of packet filtering that operates at the seventh layer (the application layer) of the Open System Interconnection (OSI) reference model. The effective use of DPI enables its users to track down, identify, categorize, reroute or stop packets with undesirable code or data.

DPI is normally more effective than typical packet filtering, which inspects only the packet headers. DPI inspects the packet's data part (and sometimes the packet header) when it goes over an inspection point, attempting to find protocol noncompliance, intrusions, spam, viruses or other predefined factors to determine whether the packet can pass or whether it must be directed to another location.

With DPI, organizations can boost their network management systems without investing heavily in core network technologies.

Deep packet inspection is also known as complete packet inspection and information extraction.

The major players in global Deep Packet Inspection (DPI) market include Cisco Systems, International Business Machine (IBM), Intel, etc. The top 3 players occupy
