Deep threaded screw is an orthopedic screw used for fracture fixation surgery. It has a threaded design that allows for more purchases in the bones, providing higher stability and reducing the risk of screws being pulled out or loosened. Deep threaded screws are typically used for situations with poor bone quality, such as osteoporosis, or situations that require greater stability, such as comminuted fractures where bones are broken into multiple pieces. They are also used in situations where traditional screws may not provide sufficient stability, such as long bone fractures. The deep threaded design of these screws allows for more purchases in the bones, which helps to distribute loads more evenly and reduce stress on the bones. This helps promote bone healing and reduce the risk of complications.
