Abstracts

According to our (Global Info Research) latest study, the global Deep UV KrF and ArF Photoresist market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Deep UV KrF and ArF photoresists are key materials used in semiconductor manufacturing for deep UV lithography processes. KrF photoresist uses krypton fluoride laser as the light source, with a wavelength of 248 nanometers. KrF photoresist is suitable for relatively large process nodes, has high resolution and a long history of practical application. ArF photoresist uses an argon fluoride laser as a light source with a wavelength of 193 nanometers. ArF photoresist is suitable for smaller process nodes, with higher resolution and smaller line width capabilities.

Deep UV KrF and ArF photoresists differ in terms of light source wavelength, resolution, line width, process application, etc. It is necessary to select the appropriate deep UV photoresist based on specific process requirements, cost, equipment compatibility and other factors. At the same time, the selection of photoresist must also consider compatibility with other process steps (such as masks and photolithography machines).
