## Abstracts

According to our (Global Info Research) latest study, the global Deepfake Detection Software market size was valued at US\$ 296 million in 2025 and is forecast to a readjusted size of US\$ 2634 million by 2032 with a CAGR of 37.1% during review period.

Deepfake Detection Software is defined as a type of application or program designed to detect and identify content that has been altered or synthesized using Deepfake technology. This technology leverages advanced algorithms, typically based on artificial intelligence (AI) and machine learning, to analyze digital media such as images, videos, and audio files.

The primary function of Deepfake Detection Software is to scan and analyze media content for any signs of manipulation or synthesis that are indicative of Deepfake activity. This includes detecting anomalies in facial features, audio spectrums, and other signals that may suggest the content has been altered. The software uses a variety of techniques, such as cross-validation of multi-modal data (e.g., synchronizing facial features with speech content in videos) to ensure the authenticity of the media.
