In cosmetics, antifoaming agents are usually added to shampoos, shower gels, facial cleansers and other products to help control the generation and stability of foam. The main function of a defoamer is to break the surface tension on the surface of the liquid so that foam cannot easily form or remain stable. They reduce the persistence and amount of foam, thus providing a better product experience. In addition, antifoaming agents can also prevent skin or eye irritation when there is too much foam. Common defoamers include compounds such as silicone oil derivatives (such as polydimethylsiloxane), polyamides, polyesters, fatty alcohols, and fatty acids. They are added to cosmetics at the right concentration to achieve the desired defoaming effect. This report is a detailed and comprehensive analysis for global Defoamer for Cosmetic market.
