The global Defoamer for Cosmetic market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A defoamer is a chemical used to reduce or eliminate foam that develops on the surface of a liquid. In cosmetics, antifoaming agents are usually added to shampoos, shower gels, facial cleansers and other products to help control the generation and stability of foam. The main function of a defoamer is to break the surface tension on the surface of the liquid so that foam cannot easily form or remain stable. They reduce the persistence and amount of foam, thus providing a better product experience. In addition, antifoaming agents can also prevent skin or eye irritation when there is too much foam. Common defoamers include compounds such as silicone oil derivatives (such as polydimethylsiloxane), polyamides, polyesters, fatty alcohols, and fatty acids. They are added to cosmetics at the right concentration to achieve the desired defoaming effect. This report studies the global Defoamer for Cosmetic production, demand, key manufacturers, and key regions.
