According to our (Global Info Research) latest study, the global Defoamer for Water-Based Ink market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Defoamer for water-based ink is a chemical additive used to reduce or eliminate foam formation in water-based inks. Foam can be problematic as it can affect the quality of prints, cause ink splattering, and lead to production disruptions. Defoamers work by reducing the surface tension of the ink, disrupting the foam structure, and allowing air bubbles to be released. This helps to maintain the stability and consistency of the ink, resulting in improved print quality and production efficiency. Defoamer for water-based ink is commonly used in various industries, including printing and packaging, textiles, and coatings.

The industry trend of defoamer for water-based ink is witnessing steady growth due to several factors. Firstly, there is an increasing demand for high-quality prints with minimal defects, which necessitates the use of defoamers to control foam formation and improve print consistency. Additionally, environmental regulations promoting the use of water-based inks over solvent-based options have further driven the adoption of defoamers in this sector. Furthermore, technological advancements in defoamer formulations, such as the development of silicone-free defoamers, are gaining popularity due to their enhanced efficiency and sustainability. With a growing emphasis on sustainable practices and improved print performance, the demand for defoamer for water-based ink is expected to continue its upward trend.
