Abstracts

According to our (Global Info Research) latest study, the global Degreasing and Sintering Integrated Furnace market size was valued at US\$ 593 million in 2025 and is forecast to a readjusted size of US\$ 1019 million by 2032 with a CAGR of 8.0% during review period.

In 2025, global sales of integrated debinding and sintering furnaces reached 4,800 units, with an average selling price of US\$120,000 per unit. Integrated debinding and sintering furnaces are high-end heat treatment equipment that integrates the two key processes of debinding and sintering in powder metallurgy or metal injection molding (MIM) into a single device. By first removing the binder from the formed blank under a controlled atmosphere or vacuum environment, and then performing high-temperature sintering densification treatment, integrated continuous processing of parts is achieved. It boasts advantages such as high process stability, low energy consumption, high production efficiency, and high automation, and is widely used in automotive parts, 3C electronics, medical devices, and precision machinery.

Upstream raw materials mainly include high-temperature resistant furnace body materials (such as graphite and ceramic fiber), heating elements, vacuum system components, and control systems. Downstream customers are mainly powder metallurgy companies, MIM manufacturers, and high-end component processing plants. In the future, with the increasing demand for precision manufacturing and micro-complex structural parts, the equipment will develop towards larger scale, continuous operation, and intelligence. The industry's total capacity is approximately 7,000 units per year, with a gross profit margin of about 38%. Downstream consumption is mainly concentrated in the powder metallurgy and MIM fields, with consumer electronics and

automotive parts accounting for the largest share. Among upstream materials, high-temperature structural materials and core heating components account for the largest proportion. On the demand side, with the increasing precision of 3C products and the trend of lightweighting in automobiles, as well as the accelerated process of domestic substitution, the market demand for debinding and sintering integrated furnaces continues to be released. At the same time, the upgrading of high-end equipment and the construction of customized production lines bring significant business opportunities to the industry.
