## Abstracts

According to our (Global Info Research) latest study, the global Delay Line Interferometer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The delay line interferometer is an optical interferometer for measuring the displacement or vibration of objects with high accuracy. The interferometer consists of two optical paths, one of which is delayed for a certain time relative to the other. This delay is usually introduced by optical fiber or delay line. When the laser beam is divided into these two paths and recombined, the resulting interference pattern is sensitive to any phase shift between the two paths. These phase shifts can be caused by any change in the length of one of the paths, such as the vibration or motion of the measured object. By measuring these phase shifts, the delay-line interferometer can accurately determine the displacement or vibration of the object.
