Abstracts

Demand response is a change in the power consumption of an electric utility customer to better match the demand for power with the supply. Until recently electric energy could not be easily stored, so utilities have traditionally matched demand and supply by throttling the production rate of their power plants, taking generating units on or off line, or importing power from other utilities. There are limits to what can be achieved on the supply side, because some generating units can take a long time to come up to full power, some units may be very expensive to operate, and demand can at times be greater than the capacity of all the available power plants put together. Demand response seeks to adjust the demand for power instead of adjusting the supply.

According to our (Global Info Research) latest study, the global Demand Response (DR) market size was valued at USD 6746.7 million in 2022 and is forecast to a readjusted size of USD 9508.6 million by 2029 with a CAGR of 5.0% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
